

Rear Axle Filtration Kit

For 785C and 789C Off-Highway Trucks

Rear Axle Filtration Kit

A field installed rear axle filtration retrofit kit replaces the existing rear axle oil filter on 785C and 789C off-highway trucks. The new filter has improved filtration capability and has been relocated to better guard against damage.

Cat® 785C and 789C Rear Axle Filtration Kit

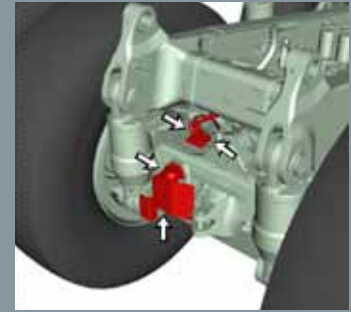

Coverage:

Model	Retrofit Kit Part Number
785C (APX, 5AZ, 1HW)	341-2529
789C (2BW)	375-3502

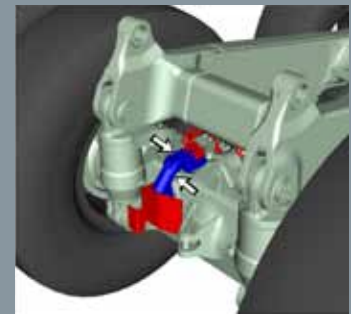

This filter retrofit replaces the existing oil filter and relocates it to the top of the housing. Both kits contain the (334-0572) filter group which includes a 328-3655 advanced efficiency filter element for improved oil cleanliness. The new filter element has an 11 micron maximum rating, compared to a 20 micron maximum rating of the previous filter element. The new element also has a larger media surface area which increases dirt holding capacity from 70 gms to 210 gms.

The new filtration system provides a cleaner system with a more conveniently located filter group.
